

THERMALATLAS

User Manual

Native macOS menu bar temperature monitoring for Apple silicon

REAL READINGS

CPU, GPU, internal SSD and every detected physical external SSD.

READ-ONLY

No fan, power or system setting is changed.

LOCAL

No accounts, telemetry or cloud synchronisation.

IMPORTANT

When no real sensor or SMART value is available, ThermalAtlas shows “Not available” — it never estimates or invents a value.

Readings at a glance

Each card pairs a real source with a clear status.

CPU / GPU

Average of the matching CPU sensors or GPU zones that are readable at that moment.

SSD / SMART

Temperature, SMART status and health appear only when macOS actually supplies the data.

LAST GPU VALUE

A brief failure can be explicitly marked as the last real GPU value; after expiry it correctly becomes Not available.

GREEN

Cool / normal: below 55 °C.

ORANGE

Elevated: 55 °C to below 75 °C.

RED / GRAY

High from 75 °C / no real reading available.

Themes

All four themes display the same sensor data.

Classic

Liquid Glass

Aurora

Ember

LIQUID GLASS

Follows macOS light and dark appearance. When Reduce Transparency is enabled, ThermalAtlas uses an opaque fallback for legibility.

The shared menu

All secondary actions live behind the ellipsis button.

THEMES

Choose Classic, Liquid Glass, Aurora or Ember. The active appearance has a checkmark.

SCAN REFRESH

Choose 1, 2, 3 or 4 seconds. Default is 2 seconds. A shorter interval only checks more often; it changes no hardware setting.

Language & manuals

English is the app's default language.

- **Language**
Choose English or Deutsch; visible app text is stored locally.
- **Manuals**
Open the English Manual or Deutsches Handbuch in the default browser.
- **Open Activity Monitor**
Launches macOS Activity Monitor only after you choose it.
- **Quit ThermalAtlas**
Stops the app and periodic sensor refresh.

STORED LOCALLY

Theme, refresh interval and language choice are the only stored settings. Drive names and readings remain unchanged.

WHAT CHANGES

The language choice affects visible controls and status labels only; it changes neither readings nor your drive names.

Real data, clear limits

The display is deliberately defensive rather than speculative.

● NOT AVAILABLE

Not a fault judgement: macOS, a sensor or an external enclosure may not provide a temperature.

● EXTERNAL SSDs

Each detected physical SSD receives its own card. Virtual disk images are ignored.

● SMART HEALTH

Derived only from the real NVMe PERCENTAGE_USED field. Without it there is no percentage.

● PRIVACY

No accounts, telemetry, analytics services, cloud synchronisation or third-party dependencies.

INSTALLATION

Download available packages only from the official GitHub Releases. Open the DMG, drag ThermalAtlas.app to Applications and launch it. For a non-notarized prerelease, confirm Finder right-click → Open on first launch; if needed choose Open Anyway in Privacy & Security.

REQUIREMENTS

macOS 14 or later and Apple silicon. ThermalAtlas reads local sensor data; optional GitHub, homepage and manual links hand a public URL to the default browser only after user action.
