

# ThermalAtlas

## User Manual

Compact temperature monitoring for Apple silicon

### What the app does

ThermalAtlas shows real CPU, GPU and available SSD temperatures directly from the macOS menu bar. It does not change fan, power or system settings.

### Installation

Download the current package from GitHub Releases, open the DMG and drag ThermalAtlas to Applications.

### First launch

If Gatekeeper warns you: right-click ThermalAtlas.app > Open. On first launch, macOS may also show a permission request for access to required system/sensor data. Allow it, otherwise temperature readings may be unavailable.

#### ThermalAtlas

Temperaturen dieses Macs

##### CPU

Apple-Silicon CPU-Kerne · Mittelwe...

49,7°

##### GPU

Apple-Silicon GPU-Zonen · Mittelw...

41,5°

##### Interne SSD

APPLE SSD AP0512Z

33,9°

##### Externe SSD

KINGSTON SFYRD2000G

41,9°

Theme

### Quick facts

- No account, no telemetry.
- Local temperature monitoring.
- Unavailable values are not estimated.

# Interface and Sensors

Full screenshot with explanations of all reading areas

## CPU

Current CPU temperature; average of readable Apple-silicon CPU sensors.

## GPU

Current GPU temperature from readable GPU zones.

## Internal SSD

SMART temperature when macOS exposes a real value.

## External SSD

Shown separately when an external SSD is detected and exposes SMART temperature.

## Status colors

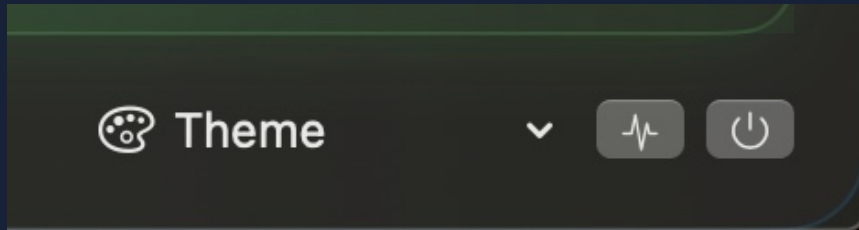

Green = cooler range, orange = elevated, red = high, gray = no real value available.

## Refresh

The app refreshes sensor values regularly; the latest update time is shown at the bottom.

# Buttons, Themes and Technical Notes

Close-up of the bottom control bar

## Theme

Opens Classic, Liquid Glass, Aurora and Ember. The selection is stored locally.

## Activity Monitor

The waveform button opens macOS Activity Monitor.

## Quit

The power button quits ThermalAtlas completely.

## Not available

ThermalAtlas does not invent values. If a sensor or drive exposes no real temperature, the value intentionally remains unavailable.

## Privacy and resources

- No accounts, telemetry or cloud sync.
- CPU/GPU sensor access is read-only.
- Liquid Glass no longer has a continuous glow animation.
- The app is compact; exact CPU/GPU usage claims should wait for runtime testing.
